[19]
CC -1- FUNCTION: Core protein packages viral RNA to form a viral
CC nucleocapsid, and promotes virion budding. Modulates viral
CC translation initiation by interacting with HCV IRES and 40S
CC ribosomal subunit. Also regulates many host cellular functions
CC such as signaling pathways and apoptosis. Prevents the
CC establishment of cellular antiviral state by blocking the
CC interferon-alpha/beta (IFN-alpha/beta) and IFN-gamma signaling
CC pathways and by inducing human STAT1 degradation. Plays an
CC important role in virus-mediated cell transformation leading to
CC hepatocellular carcinomas. Interacts with, and activates STAT3
CC leading to cellular transformation. May repress the promoter of
CC p53, and sequester CREB3 and Sp110 isoform 3/Sp110b in the
CC cytoplasm. Also represses cell cycle negative regulating factor
CC CDKN1A, thereby interrupting an important check point of normal
CC cell cycle regulation. Targets transcription factors involved in
CC the regulation of inflammatory responses and in the immune
CC response: suppresses NK-kappaB activation, and activates AP-1.
CC Mediates apoptotic pathways through association with TNF-type
CC receptors TNFRSF1A and LTBR, although its effect on death
CC receptors-induced apoptosis remains controversial. Enhances TRAIL
CC mediated apoptosis, suggesting that it might play a role in
CC immune-mediated liver cell injury. Secreted core protein is able
CC to bind C1qR1 at the T-cell surface, resulting in down-regulation
CC of T-lymphocytes proliferation. May transactivate human MYC, Rous
CC sarcoma virus LTR, and SV40 promoters. May suppress the human FOS
CC and HIV-1 LTR activity. May alter lipid metabolism by interacting
CC with hepatocellular proteins involved in lipid accumulation and
CC storage.
CC -1- FUNCTION: Envelope glycoproteins E1 and E2 are involved in virus
CC attachment to the host cell as well as in virus endocytosis and
CC fusion with host membrane (by similarity). E2 inhibits human PRKR
CC activation, preventing the establishment of an antiviral state.
CC -1- FUNCTION: p7 seems to be a hexameric ion channel protein
CC (viroporin) and is inhibited by the antiviral drug amantadine.
CC Also inhibited by long-alkyl-chain iminosugar derivatives.
CC Essential for infectivity (by similarity).
CC -1- FUNCTION: Protease NS2-3, which is a putative cysteine protease,
CC is responsible for the autocatalytic cleavage of NS2-NS3. Seems to
CC undergo self-inactivation following maturation.
CC -1- FUNCTION: NS3 displays three distinct enzymatic activities: serine
CC protease, NTPase and RNA helicase. NS3 serine protease, in
CC association with NS4A, is responsible for the cleavages of NS3-
CC NS4A, NS4A-NS4B, NS4B-NS5A and NS5A-NS5B. NS3/NS4A complex also
CC prevents phosphorylation of human IRE3, thus preventing the
CC establishment of dsRNA induced antiviral state. NS3 RNA helicase
CC binds to RNA and unwinds dsRNA in the 3' to 5' direction (by
CC similarity).
CC -1- FUNCTION: NS4B may induce a specific membrane alteration that
CC serves as a scaffold for the virus replication complex. This
CC membrane alteration gives rise to the so called ER-derived
CC membranous web that contains the replication complex (by
CC similarity).

CC -1- FUNCTION: Core protein packages viral RNA to form a viral

nucleocapsid, and promotes virion budding. Modulates viral translation initiation by interacting with HCV IRES and 40S ribosomal subunit. Also regulates many host cellular functions such as signaling pathways and apoptosis. Prevents the establishment of cellular antiviral state by blocking the interferon-alpha/beta (IFN-alpha/beta) and IFN-gamma signaling pathways and by inducing human STAT1 degradation. Plays an important role in virus-mediated cell transformation leading to hepatocellular carcinomas. Interacts with, and activates STAT3 leading to cellular transformation. May repress the promoter of p53, and sequester CREB3 and Sp110 isoform 3/Sp110b in the cytoplasm. Also represses cell cycle negative regulating factor CDKN1A, thereby interrupting an important checkpoint of normal cell cycle regulation. Targets transcription factors involved in the regulation of inflammatory responses and in the immune response; suppresses NK-kappaB activation, and activates AP-1. Mediates apoptotic pathways through association with TNF-type receptors TNFRSF1A and LTBR, although its effect on death receptor-induced apoptosis remains controversial. Enhances TRAIL mediated apoptosis, suggesting that it might play a role in immune-mediated liver cell injury. Secreted core protein is able to bind ClO81 at the T-cell surface, resulting in down-regulation of T-lymphocytes proliferation. May transactivate human MYC, Rous sarcoma virus LTR, and SV40 promoters. May suppress the human FOS and HIV-1 LTR activity. May alter lipid metabolism by interacting with hepatocellular proteins involved in lipid accumulation and storage (By similarity).
-1- FUNCTION: Envelope glycoproteins E1 and E2 are involved in virus attachment to the host cell as well as in virus endocytosis and fusion with host membrane. E2 inhibits human PKR activation, preventing the establishment of an antiviral state (By similarity).
-1- FUNCTION: p7 seems to be a hexameric ion channel protein (viroporin) and is inhibited by the antiviral drug amantadine. Also inhibited by long-alkyl-chain iminosugar derivatives.
-1- FUNCTION: Protease NS2-3, which is a putative cysteine protease, is responsible for the autocatalytic cleavage of NS2-NS3. Seems to undergo self-inactivation following maturation (By similarity).
-1- FUNCTION: NS3 displays three distinct enzymatic activities: serine protease, NTPase and RNA helicase. NS3 serine protease, in association with NS4A, is responsible for the cleavages of NS3-NS4A, NS4A-NS4B, NS4B-NS5A and NS5A-NS5B. NS3 RNA helicase binds to RNA and unwinds dsRNA in the 3' to 5' direction (By similarity). NS3/NS4A complex also prevents phosphorylation of human IRE3, thus preventing the establishment of dsRNA induced antiviral state.
-1- FUNCTION: NS4B may induce a specific membrane alteration that serves as a scaffold for the virus replication complex. This membrane alteration gives rise to the so called ER-derived membranous web that contains the replication complex (By similarity).
-1- FUNCTION: NS5A is a component of the replication complex. Downregulates viral IRES translation initiation. Mediates interferon resistance, presumably by interacting with and inhibiting human PKR/p38. The hyperphosphorylated form of NS5A is an inhibitor of viral replication (By similarity).
-1- FUNCTION: NS5B is a RNA-dependent RNA polymerase that plays an essential role in the virus replication (By similarity).
-1- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the p6 position, Cys or Thr in p1 and Ser or Ala in p1'.
-1- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + {RNA} (N).
-1- COFACTOR: Binds 1 zinc ion per NS3 protease domain. Binds 1 zinc ion per NS5A N-terminal domain (By similarity).
-1- ENZYME REGULATION: Activity of protease NS2-3 is dependent on zinc ions and completely inhibited by EDTA. Serine protease NS3 is also activated by zinc ions (By similarity).
-1- SUBUNIT: Core protein is a homodimer that binds the C-terminal part of E1. Interacts with numerous cellular proteins. Interacts with human STAT1, inducing its degradation and human STAT3, constitutively activating it. Associates with human LTBR and

TNFRSF1A receptors and possibly induces apoptosis. Binds to human SP110 isoform 3/Sp110b, HNRPK, CLOR1, YWHAZ, DDX3X, APOA2 and RXRA proteins. Interacts with human CREB3, nuclear transcription protein, triggering cell transformation. May interact with human p53. Also binds human cytochromes KRT8, KRT18, KRT19 and VIM (vimentin). E1 and E2 glycoproteins form a heterodimer that binds to human LDLR, CD81 and SCAR1 receptors, but this binding is not sufficient for infection, some additional liver specific cofactors may be needed. E2 binds and inhibits human PRKR. p7 forms a homohexamer. NS2 forms a homodimer and interacts with all other nonstructural (NS) proteins. NS4A interacts with NS3 serine protease and stabilizes it. NS3-NS4A complex is essential for the activation of the latter and allows membrane anchorage of NS3. NS4B forms a homodimer and interacts with all other NS proteins. NS5A forms a homodimer and interacts with all other nonstructural (NS) proteins. NS5A also interacts with human PRKR, GRB2, PIK3R1 and with most Src-family kinases. NS5B is a homooligomer (By similarity).

-I- SUBCELLULAR LOCATION: The virion assembly and budding occurs from the ER membrane. The N-terminal transmembrane domains of the polyprotein probably possess an endoplasmic reticulum (ER) signal sequence function in their C-termini, leading the nascent polyprotein to the ER membrane. After cleavage by host signal peptidase, these ER signal peptides retain at the C-terminus of the concerned proteins (core, E1, E2 and p7), serving as ER membrane anchors. Core protein is cytoplasmic. It is also located on mitochondrial and endoplasmic reticulum membranes and at the surface of lipid droplets. A minor proportion is present in the nucleus. An unknown proportion is secreted. E1, E2, NS2 and NS4B are integral ER membrane proteins. The C-terminal transmembrane domains of envelope glycoproteins E1 and E2 form a hairpin structure before cleavage by host signal peptidase. A reorientation of the second hydrophobic stretch occurs after cleavage producing a single reoriented transmembrane domain. These events explain the final topology of these proteins. ER retention of E1 and E2 is leaky and, in overexpression conditions, a small fraction of both proteins reaches the plasma membrane. NS3 is associated to the ER membrane through its binding to NS4A. NS5A Membrane insertion of the membrane-anchored proteins NS4A, NS5A and NS5B occurs after processing by the NS3 protease. NS5A is perinuclear. A fraction of p7 localizes to the plasma membrane (By similarity).

-I- DOMAIN: The transmembrane regions of envelope E1 and E2 glycoproteins are involved in heterodimer formation. ER localization, and assembly of these proteins. Envelope E2 glycoprotein contain two highly variable regions called hypervariable region 1 and 2 (HVR1 and HVR2) and two CD81-binding sites. HVR1 is implicated in the SCAR1-mediated cell entry. HVR2 and CD81-binding sites may be involved in sensitivity and/or resistance to IFN-alpha therapy (By similarity).

-I- DOMAIN: The C-terminus of NS5A contains two variable regions called interferon sensitivity determining region (ISDR) and variable region 3 (V3). ISDR and V3 may be involved in sensitivity and/or resistance to IFN-alpha therapy (By similarity).

-I- DOMAIN: The N-terminal one-third of serine protease NS3 contains the protease activity. This region contains a zinc atom that does not belong to the active site, but may play a structural rather than a catalytic role. This region is essential for the activity of protease NS2-3, maybe by contributing to the folding of the latter. The helicase activity is located in the C-terminus (By similarity).

-I- PM: Specific enzymatic cleavages in vivo yield mature proteins. The structural proteins, core, E1, E2 and p7 are produced by proteolytic processing by host signal peptidases. The core protein is synthesized as a 21 kDa precursor which is retained in the ER membrane through a hydrophobic propeptide, which is cleaved to release the 19 kDa mature core protein. The other proteins are cleaved by the viral proteases (By similarity).

 CC -1- FUNCTION: Core protein packages viral RNA to form a viral
 CC nucleocapsid, and promotes virion budding. Modulates viral
 CC translation initiation by interacting with HCV IRES and 40S
 CC ribosomal subunit. Also regulates many host cellular functions
 CC such as signaling pathways and apoptosis. Prevents the
 CC establishment of cellular antiviral state by blocking the
 CC interferon-alpha/beta (IFN-alpha/beta) and IFN-gamma signaling
 CC pathways and by inducing human STAT1 degradation. Plays an
 CC important role in virus-mediated cell transformation leading to
 CC hepatocellular carcinomas. Interacts with, and activates SPAT3
 CC leading to cellular transformation. May repress the promoter of
 CC p53, and sequester CREB3 and Sp110 isoform 3/Sp110b in the
 CC cytoplasm. Also represses cell cycle negative regulating factor
 CC CDKN1A, thereby interrupting an important check point of normal
 CC cell cycle regulation. Targets transcription factors involved in
 CC the regulation of inflammatory responses and in the immune
 CC response; suppresses NK-kappaB activation, and activates AP-1.
 CC Mediates apoptotic pathways through association with TNF-type
 CC receptors TNFRSF1A and LTR, although its effect on death
 CC receptors-induced apoptosis remains controversial. Enhances TRAIL
 CC mediated apoptosis, suggesting that it might play a role in
 CC immune-mediated liver cell injury. Secreted core protein is able
 CC to bind C10R1 at the T-cell surface, resulting in down-regulation
 CC of T-lymphocytes proliferation. May transactivate human MYC, Rous
 CC sarcoma virus LTR, and SV40 promoters. May suppress the human FOS
 CC and HIV-1 LTR activity. May alter lipid metabolism by interacting
 CC with hepatocellular proteins involved in lipid accumulation and
 CC storage (By similarity).
 CC -1- FUNCTION: Envelope glycoproteins E1 and E2 are involved in virus
 CC attachment to the host cell as well as in virus endocytosis and
 CC fusion with host membrane. E2 inhibits human PRKR activation,
 CC preventing the establishment of an antiviral state (By
 CC similarity).
 CC -1- FUNCTION: p7 seems to be a hexameric ion channel protein
 CC (viroporin) and is inhibited by the antiviral drug amantadine.
 CC Also inhibited by long-alkyl-chain iminosugar derivatives.
 CC Essential for infectivity (By similarity).
 CC -1- FUNCTION: Protease NS2-3, which is a putative cysteine protease,
 CC is responsible for the autocatalytic cleavage of NS2-NS3. Seems to
 CC undergo self-inactivation following maturation (By similarity).
 CC -1- FUNCTION: NS3 displays three distinct enzymatic activities: serine
 CC protease, NTPase and RNA helicase. NS3 serine protease, in
 CC association with NS4A, is responsible for the cleavages of NS3-
 CC NS4A, NS4A-NS4B, NS4B-NS5A and NS5A-NS5B. NS3 RNA helicase binds
 CC to RNA and unwinds dsRNA in the 3' to 5' direction. NS3/NS4A
 CC complex also prevents phosphorylation of human IRF3, thus
 CC preventing the establishment of dsRNA induced antiviral state (By
 CC similarity).
 CC -1- FUNCTION: NS4B may induce a specific membrane alteration that
 CC serves as a scaffold for the virus replication complex. This
 CC membrane alteration gives rise to the so called ER-derived
 CC membranous web that contains the replication complex (By
 CC similarity).
 CC -1- FUNCTION: NS5A is a component of the replication complex.
 CC Downregulates viral IRES translation initiation. Mediates
 CC interferon resistance, presumably by interacting with and
 CC inhibiting human PRKR/PKR. The hyperphosphorylated form of NS5A is
 CC an inhibitor of viral replication (By similarity).
 CC -1- FUNCTION: NS5B is a RNA-dependent RNA polymerase that plays an
 CC essential role in the virus replication (By similarity).
 CC -1- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
 CC precursor polyprotein, commonly with Asp or Glu in the p6
 CC position, Cys or Thr in p1 and Ser or Ala in p1'.
 CC -1- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
 CC [RNA] (N).
 CC -1- COFACTOR: Binds 1 zinc ion per NS3 protease domain. Binds 1 zinc
 CC ion per NS5A N-terminal domain (By similarity).
 CC -1- ENZYME REGULATION: Activity of protease NS2-3 is dependent on zinc
 CC ions and completely inhibited by EDTA. Serine protease NS3 is also
 CC activated by zinc ions (By similarity).
 CC -1- SUBUNIT: Core protein is a homomultimer that binds the C-terminal
 CC part of E1. Interacts with numerous cellular proteins. Interacts
 CC with human STAT1, inducing its degradation and human SPAT3,
 CC constitutively activating it. Associates with human LTR and
 CC TNFRSF1A receptors and possibly induces apoptosis. Binds to human
 CC Sp110 isoform 3/Sp110b, HNRPK, C10R1, YWHA, DDX3X, APOA2 and RXRA
 CC proteins. Interacts with human CREB3 nuclear transcription
 CC protein, triggering cell transformation. May interact with human
 CC p53. Also binds human cytochromes KRT8, KRT18, KRT19 and VIM
 CC (vimentin). E1 and E2 glycoproteins form a heterodimer that binds
 CC to human LDLR, CD81 and SCARB1 receptors, but this binding is not
 CC sufficient for infection, some additional liver specific cofactors
 CC may be needed. E2 binds and inhibits human PRKR. p7 forms a
 CC homohexamer. NS2 forms a homodimer and interacts with all other
 CC nonstructural (NS) proteins. NS4A interacts with NS3 serine
 CC protease and stabilizes it. NS3-NS4A complex is essential for the
 CC activation of the latter and allows membrane anchorage of NS3.
 CC NS4B forms a homodimer and interacts with all other NS proteins.
 CC NS5A forms a homodimer and interacts with all other nonstructural
 CC (NS) proteins. NS5A also interacts with human PRKR, GRB2, PIK3R1
 CC and with most Src-family kinases. NS5B is a homooligomer (By
 CC similarity).
 CC -1- SUBCELLULAR LOCATION: The virion assembly and budding occurs from
 CC the ER membrane. The N-terminal transmembrane domains of the
 CC polyprotein probably possess an endoplasmic reticulum (ER) signal
 CC sequence function in their C-termini, leading the nascent
 CC polyprotein to the ER membrane. After cleavage by host signal
 CC peptidase, these ER signal peptides retain at the C-terminus of
 CC the concerned proteins (core, E1, E2 and p7), serving as ER
 CC membrane anchors. Core protein is cytoplasmic. It is also located
 CC on mitochondrial and endoplasmic reticulum membranes and at the
 CC surface of lipid droplets. A minor proportion is present in the
 CC nucleus. An unknown proportion is secreted. E1, E2, NS2 and NS4B
 CC are integral ER membrane proteins. The C-terminal transmembrane
 CC domains of envelope glycoproteins E1 and E2 form a hairpin
 CC structure before cleavage by host signal peptidase. A
 CC reorientation of the second hydrophobic stretch occurs after
 CC cleavage producing a single reoriented transmembrane domain. These
 CC events explain the final topology of these proteins. ER retention
 CC of E1 and E2 is leaky and, in overexpression conditions, a small
 CC fraction of both proteins reaches the plasma membrane. NS3 is
 CC associated to the ER membrane through its binding to NS4A.
 CC Membrane insertion of the membrane-anchored proteins NS4A, NS5A
 CC and NS5B occurs after processing by the NS3 protease. NS5A is
 CC perinuclear. A fraction of p7 localizes to the plasma membrane (By
 CC similarity).
 CC -1- DOMAIN: The transmembrane regions of envelope E1 and E2
 CC glycoproteins are involved in heterodimer formation, ER
 CC localization, and assembly of these proteins. Envelope E2
 CC glycoprotein contain two highly variable regions called
 CC hypervariable region 1 and 2 (HVR1 and HVR2) and two CD81-binding

CC sites. HVR1 is implicated in the SCARBI-mediated cell entry. HVR2
 CC and CD81-binding sites may be involved in sensitivity and/or
 CC resistance to IFN-alpha therapy (By similarity).
 CC -1- DOMAIN: The C-terminus of NS5A contains two variable regions
 CC called interferon sensitivity determining region (ISDR) and
 CC variable region 3 (V3). ISDR and V3 may be involved in sensitivity
 CC and/or resistance to IFN-alpha therapy (By similarity).
 CC -1- DOMAIN: The N-terminal one-third of serine protease NS3 contains
 CC the protease activity. This region contains a zinc atom that does
 CC not belong to the active site, but may play a structural rather
 CC than a catalytic role. This region is essential for the activity
 CC of protease NS2-3, maybe by contributing to the folding of the
 CC latter. The helicase activity is located in the C-terminus (By
 CC similarity).
 CC -1- PTM: Specific enzymatic cleavages in vivo yield mature proteins.
 CC The structural proteins, core, E1, E2 and p7 are produced by
 CC proteolytic processing by host signal peptidases. The core protein
 CC is synthesized as a 21 kDa precursor which is retained in the ER
 CC membrane through a hydrophobic propeptide, which is cleaved to
 CC release the 19 kDa mature core protein. The other proteins are
 CC cleaved by the viral proteases (By similarity).
 CC -1- PTM: Envelope E1 and E2 glycoproteins are highly N-glycosylated
 CC (By similarity).
 CC -1- PTM: Core protein is phosphorylated by host PKC and PKA (By
 CC similarity).
 CC -1- PTM: NS5A is phosphorylated in a basal form termed p56. p58 is an
 CC hyperphosphorylated form of p56. p56 and p58 coexist in the cell
 CC in roughly equivalent amounts. Hyperphosphorylation is dependent
 CC on the presence of NS4B in cis. Human AKT1, RPS6KB1/p70S6K,
 CC MAP2K1/MEK1 and MAP2K6/MEK6 kinases may be responsible for NS5A
 CC phosphorylation (By similarity).
 CC -1- MISCELLANEOUS: Cell culture adaptation of the virus leads to
 CC mutations in NS5A, reducing its inhibitory effect on replication
 CC (By similarity).
 CC -1- MISCELLANEOUS: The virion is a nucleocapsid covered by a
 CC lipoprotein envelope. The nucleocapsid is composed of the core
 CC protein, forming an internal icosahedral coat that encapsidates
 CC the genomic RNA. The envelope contains two proteins: the envelope
 CC glycoproteins E1 and E2.
 CC -1- MISCELLANEOUS: Core protein exerts viral interference on hepatitis
 CC B virus when HCV and HBV coinfect the same cell, by suppressing
 CC HBV gene expression, RNA encapsidation and budding (By
 CC similarity).
 CC -1- SIMILARITY: Contains 1 peptidase C18 domain.
 CC -1- SIMILARITY: Contains 1 peptidase S29 domain.
 CC -1- CAUTION: There is a doubt concerning the orientation of the N-
 CC terminus of NS4B, which could be luminal with a 5th transmembrane
 CC segment. The C-terminus of NS2 may be luminal with a fourth
 CC transmembrane segment.
 CC -1- CAUTION: The core gene probably also codes for alternative reading
 CC frame proteins (ARFPs). Many functions depicted for the core
 CC protein might belong to the ARFPs.
 CC -1- DATABASE: NAME=suHCVdb; NOTE=The European HCV database";

-1- FUNCTION: Core protein packages viral RNA to form a viral
CC nucleocapsid, and promotes virion budding. Modulates viral
CC translation initiation by interacting with HCV IRES and 40S
CC ribosomal subunit. Also regulates many host cellular functions
CC such as signaling pathways and apoptosis. Prevents the
CC establishment of cellular antiviral state by blocking the
CC interferon-alpha/beta (IFN-alpha/beta) and IFN-gamma signaling
CC pathways and by inducing human STAT1 degradation. Plays an
CC important role in virus-mediated cell transformation leading to
CC hepatocellular carcinomas. Interacts with, and activates SPAT3
CC leading to cellular transformation. May repress the promoter of
CC p53, and sequester CREB3 and Sp110 isoform 3/Sp110b in the
CC cytoplasm. Also represses cell cycle negative regulating factor
CC CDKN1A, thereby interrupting an important check point of normal
CC cell cycle regulation. Targets transcription factors involved in
CC the regulation of inflammatory responses and in the immune
CC response; suppresses NK-kappaB activation, and activates AP-1.
CC Mediates apoptotic pathways through association with TNF-type
CC receptors TNFRSF1A and LTRB, although its effect on death
CC receptors-induced apoptosis remains controversial. Enhances TRAIL
CC mediated apoptosis, suggesting that it might play a role in

CC immune-mediated liver cell injury. Secreted core protein is able
CC to bind ClqR1 at the T-cell surface, resulting in down-regulation
CC of T-lymphocytes proliferation. May transactivate human MYC, Rous
CC sarcoma virus LTR, and SV40 promoters. May suppress the human FOS
CC and HIV-1 LTR activity. May alter lipid metabolism by interacting
CC with hepatocellular proteins involved in lipid accumulation and
CC storage (By similarity).
CC -1- FUNCTION: Envelope glycoproteins E1 and E2 are involved in virus
CC attachment to the host cell as well as in virus endocytosis and
CC fusion with host membrane. E2 inhibits human PRKR activation,
CC preventing the establishment of an antiviral state (By
CC similarity).
CC -1- FUNCTION: p7 seems to be a hexameric ion channel protein
CC (viroporin) and is inhibited by the antiviral drug amantadine.
CC Also inhibited by long-alkyl-chain iminosugar derivatives.
CC Essential for infectivity (By similarity).
CC -1- FUNCTION: Protease NS2-3, which is a putative cysteine protease,
CC is responsible for the autocatalytic cleavage of NS2-NS3. Seems to
CC undergo self-inactivation following maturation (By similarity).
CC -1- FUNCTION: NS3 displays three distinct enzymatic activities: serine
CC protease, NTPase and RNA helicase. NS3 serine protease, in
CC association with NS4A, NS4B-NS5A and NS5A-NS5B. NS3/NS4A complex also
CC prevents phosphorylation of human Irf3, thus preventing the
CC establishment of dsRNA induced antiviral state. NS3 RNA helicase
CC binds to RNA and unwinds dsRNA in the 3' to 5' direction (By
CC similarity).
CC -1- FUNCTION: NS4B may induce a specific membrane alteration that
CC serves as a scaffold for the virus replication complex. This
CC membrane alteration gives rise to the so called ER-derived
CC membranous web that contains the replication complex (By
CC similarity).
CC -1- FUNCTION: NS5A is a component of the replication complex.
CC Downregulates viral IRES translation initiation. Mediates
CC interferon resistance, presumably by interacting with and
CC inhibiting human PRKR/PKR. The hyperphosphorylated form of NS5A is
CC an inhibitor of viral replication (By similarity).
CC -1- FUNCTION: NS5B is a RNA-dependent RNA polymerase that plays an
CC essential role in the virus replication (By similarity).
CC -1- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
CC precursor polyprotein, commonly with Asp or Glu in the P6
CC position, Cys or Thr in P1 and Ser or Ala in P1'.
CC -1- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
CC [RNA](N).
CC -1- COFACTOR: Binds 1 zinc ion per NS3 protease domain. Binds 1 zinc
CC ion per NS5A N-terminal domain (By similarity).
CC -1- ENZYME REGULATION: Activity of protease NS2-3 is dependent on zinc

RT protein, encoded by YOL002c, in lipid and phosphate metabolism."
RL J. Biol. Chem. 277:19609-19617(2002).
CC -1- FUNCTION: Probable receptor, which is involved in metabolic
CC pathways that regulate lipid metabolism such as fatty acid
CC oxidation.
CC -1- SUBCELLULAR LOCATION: Integral membrane protein (Potential).
CC -1- INDUCTION: Regulated by OAP1 and PIP2. Highly expressed in
CC presence of glucose. Expressed at lower level in presence of
CC glycerol or glycerol and oleate. Highly expressed in the presence
CC of saturated fatty-acids such as myristate.
CC -1- SIMILARITY: Belongs to the ADIPOR family.

RA Maier J., Witter K., Guetlich M., Ziegler I., Werner T., Nimmemann H.;
RT "Homology cloning of GTP-cyclohydrolase I from various unrelated
RT eukaryotes by reverse-transcription polymerase chain reaction using a
RT general set of degenerate primers.";
RL Biochem. Biophys. Res. Commun. 212:705-711(1995).
CC -1- CATALYTIC ACTIVITY: GTP + 2 H(2)O = formate + 2-amino-4-hydroxy-6-
CC (erythro-1,2,3-trihydroxypropyl)-dihydropteridine triphosphate.
CC -1- ENZYME REGULATION: GTP shows a positive allosteric effect, and
CC tetrahydrobiopterin inhibits the enzyme activity (By similarity).
CC -1- PATHWAY: Cofactor biosynthesis; tetrahydrofolate biosynthesis; 2-
CC amino-4-hydroxy-6-hydroxymethyl-7,8-dihydropteridine diphosphate
CC from GTP: step 1.
CC -1- SUBUNIT: Homopolymer (By similarity).
CC -1- SIMILARITY: Belongs to the GTP cyclohydrolase I family.

CC -!- FUNCTION: NDH-1 shuttles electrons from NADH, via FMN and iron-
CC sulfur (Fe-S) centers, to quinones in the respiratory chain. The
CC immediate electron acceptor for the enzyme in this species is
CC believed to be menaquinone. Couples the redox reaction to proton

translocation (for every two electrons transferred, four hydrogen ions are translocated across the cytoplasmic membrane), and thus conserves the redox energy in a proton gradient (by similarity).

-1- CATALYTIC ACTIVITY: NADH + quinone = NAD(+) + quinol.

-1- SUBCELLULAR LOCATION: Integral membrane protein.

-1- SIMILARITY: Belongs to the complex I subunit 3 family.

 CC -1- FUNCTION: Component of the ubiquinol-cytochrome c reductase
 CC complex (complex iii or cytochrome b-c1 complex), which is a
 CC respiratory chain that generates an electrochemical potential
 CC coupled to ATP synthesis (By similarity).
 CC -1- COPACTOR: Binds 2 heme groups noncovalently (By similarity).
 CC -1- SUBUNIT: The main subunits of complex b-c1 are: cytochrome b,
 CC cytochrome ci and the Rieske protein (By similarity).
 CC -1- SIMILARITY: Belongs to the cytochrome b family.

CC -!- FUNCTION: Plays a role as an inducible effector molecule that
CC mediates Fas resistance produced by surface Ig engagement in B
CC cells.
CC -!- TISSUE SPECIFICITY: Widely expressed, with the highest levels in
CC brain, thymus, kidney, and spleen.
CC -!- SIMILARITY: Belongs to the FAIM1 family.

CC -1- FUNCTION: Catalyzes the formation of 4-diphosphocytidyl-2-C-
methyl-D-erythritol from CTP and 2-C-methyl-D-erythritol 4-
phosphate (MEP) (By similarity).
CC -1- CATALYTIC ACTIVITY: CTP + 2-C-methyl-D-erythritol 4-phosphate =
diphosphate + 4-(cytidine 5'-diphospho)-2-C-methyl-D-erythritol.
CC -1- PATHWAY: Isoprenoid biosynthesis; isopentenyl-PP biosynthesis via
DXP pathway; isopentenyl-PP from 1-deoxy-D-xylulose 5-phosphate;
step 2.
CC -1- SIMILARITY: Belongs to the ispd family.

RL FEBS Lett. 428:295-298(1998).
CC -!- FUNCTION: Part of a complex that catalyzes the reversible
CC reduction of CoM-S-S-CoB to the thiol-coenzymes H-S-CoM (coenzyme
CC M) and H-S-CoB (coenzyme B). HdrE may be responsible for anchoring
CC the complex to the membrane.
CC -!- CATALYTIC ACTIVITY: Coenzyme B + coenzyme M + methanophenazine =
CC N-(7-((2-sulfoethyl)dithio)heptanoyl)-3-O-phospho-L-threonine +
```

```

CC dihydromethanophenazine.
CC -1- PATHWAY: Methanogenesis from acetate; sixth (last) step.
CC -1- PATHWAY: Methanogenesis from carbon dioxide; eighth (last) step.
CC -1- PATHWAY: Methanogenesis from methanol; third (last) step.
CC -1- SUBUNIT: The heterodisulfide reductase 2 is composed of two
CC subunits; hrdR and hrdR (By similarity).
CC -1- SUBCELLULAR LOCATION: Integral membrane protein (Potential).
CC -1- MISCELLANEOUS: Methanophenazine seems to mediate electron transfer
CC from a F420-non-reducing hydrogenase to the heterodisulfide
CC reductase 2.
CC -1- SIMILARITY: Belongs to the hrdR family.

RP NUCLEOTIDE SEQUENCE.
RA Qiu L., Wang H., Wu Z., Lu Y.T., Deng Z., Zhao G.;
RT "Identification and function analysis of a MDR efflux protein-Hmr19,
RT in a sequenced genomic DNA fragment from Streptomyces hygroscopicus
RT yingchengensis 10-22.";
RL Submitted (SEP-2004) to the EMBL/GenBank/DBJ databases.
CC -1- FUNCTION: Part of a binding-protein-dependent transport system.
CC Probably responsible for the translocation of the substrate across
CC the membrane (By similarity).
CC -1- SUBCELLULAR LOCATION: Integral membrane protein (By similarity).
CC -1- SIMILARITY: Belongs to the binding-protein-dependent transport
CC system permease family.

 CC -1- FUNCTION: Removes the amino-terminal methionine from nascent
 proteins.
 CC -1- CATALYTIC ACTIVITY: Release of N-terminal amino acids,
 preferentially methionine, from peptides and arylamides.
 CC -1- COFACTOR: Binds 2 cobalt ions per subunit.
 CC -1- BIOPHYSICOCHEMICAL PROPERTIES:
 pH dependence:
 Optimum pH is 7-8;
 Temperature dependence:
 Optimum temperature is about 90 degrees Celsius;
 -1- SUBUNIT: Monomer.
 CC -1- MASS SPECTROMETRY: MW=32848; METHOD=Electrospray; RANGE=1-295;

```
CC CC NOTE=Ref.2.
CC CC -1- SIMILARITY: Belongs to the peptidase M24C family.

fastidiosa";
J. Bacteriol. 185:1018-1026(2003).
-!- CATALYTIC ACTIVITY: (S)-dihydroorotate + O(2) = orotate +
H(2)O(2).
-!- COPACTOR: Binds 1 FMN per subunit (By similarity).
-!- PATHWAY: Nucleotide biosynthesis; UMP biosynthesis; UMP from
HCO(3)(-); step 4.
-!- SUBUNIT: Homodimer (By similarity).
-!- SUBCELLULAR LOCATION: Inner side of the membrane (By similarity).
-!- SIMILARITY: Belongs to the dihydroorotate dehydrogenase family.
Type 2 subfamily.

CC -!- FUNCTION: Cell wall formation. Diaminopimelic acid adding enzyme
CC (By similarity).
CC -!- CATALYTIC ACTIVITY: ATP + UDP-N-acetylmuramoyl-L-alanyl-D-
CC glutamate + meso-2,6-diaminoheptanedioate = ADP + phosphate + UDP-
CC N-acetylmuramoyl-L-alanyl-D-gamma-glutamyl-meso-2,6-diamino-
CC heptanedioate.
CC -!- PATHWAY: Peptidoglycan biosynthesis.
CC -!- SUBCELLULAR LOCATION: Cytoplasmic (Probable).
CC -!- SIMILARITY: Belongs to the murCDEF family.

RT "Complete genomic sequence of the filamentous nitrogen-fixing
RT cyanobacterium Anabaena sp. strain PCC 7120.";
RL DNA Res. 8:205-213(2001).
CC -!- FUNCTION: NDH-1 shuttles electrons from NAD(P)H, via FMN and iron-
CC sulfur (Fe-S) centers, to quinones in the respiratory chain. The
CC immediate electron acceptor for the enzyme in this species is

believed to be plastoquinone. Couples the redox reaction to proton translocation (for every two electrons transferred, four hydrogen ions are translocated across the cytoplasmic membrane), and thus conserves the redox energy in a proton gradient (By similarity).
 -1- CATALYTIC ACTIVITY: NAD(P)H + plastoquinone = NAD(P)(+) + plastoquinol.

RP "Complete genome sequence of the model actinomycete Streptomyces
coelicolor A3(2).";
RL Nature 417:141-147(2002).
CC -1- FUNCTION: Cytochrome c oxidase is the component of the respiratory
chain that catalyzes the reduction of oxygen to water. Subunits 1-
3 form the functional core of the enzyme complex. CO 1 is the
catalytic subunit of the enzyme. Electrons originating in
cytochrome c are transferred via the copper A center of subunit 2
and heme A of subunit 1 to the bimetallic center formed by heme A3
and copper B (By similarity).
CC -1- CATALYTIC ACTIVITY: 4 ferrocyclochrome c + O(2) = 4 ferrocyclochrome
c + 2 H(2)O.
CC -1- COPACTOR: Binds 1 copper B per subunit (By similarity).
CC -1- COPACTOR: Binds 2 heme groups per subunit (By similarity).
CC -1- PATHWAY: Respiratory chain; terminal step.
CC -1- SUBUNIT: Associates with subunits II, III and IV to form
cytochrome c oxidase (By similarity).
CC -1- SUBCELLULAR LOCATION: Integral membrane protein (By similarity).
CC -1- SIMILARITY: Belongs to the heme-copper respiratory oxidase family.
CC This Swiss-Prot entry is copyright. It is produced through a collaboration
between the Swiss Institute of Bioinformatics and the EMBL outstation -
the European Bioinformatics Institute. There are no restrictions on its
use as long as its content is in no way modified and this statement is not
removed.

CC -!- FUNCTION: Generates a proton motive force; it probably catalyzes a
CC fully reversible reaction, thus being able to synthesize
CC pyrophosphate when the proton motive force is sufficient (By
CC similarity).
CC -!- CATALYTIC ACTIVITY: Diphosphate + H(2)O = 2 phosphate.
CC -!- COPACTOR: Magnesium (By similarity).
CC -!- SUBUNIT: Homodimer (Potential).
CC -!- SUBCELLULAR LOCATION: Integral membrane protein (Probable).
CC -!- SIMILARITY: Belongs to the H(+) -translocating pyrophosphatase
CC (TC 3.A.10) family. Type 2 subfamily.

CC CC -1- FUNCTION: Involved in pH regulation to eliminate acids generated
CC by active metabolism or to counter adverse environmental
CC conditions. Major proton extruding system driven by the inward
CC sodium ion chemical gradient. Plays an important role in signal
CC transduction.
CC CC -1- BIOPHYSICOCHEMICAL PROPERTIES:
CC pH dependence:
CC Fully active at acidic pHs, the antiporter is virtually turned
CC off at neutral pH;
CC CC -1- SUBUNIT: Interacts with tescalcin, CHP and CHP2.
CC CC -1- SUBCELLULAR LOCATION: Integral membrane protein.
CC CC -1- TISSUE SPECIFICITY: Kidney and intestine.

CC CC -1- PTM: Phosphorylated (Possible).
CC CC -1- MISCELLANEOUS: Inhibited by amiloride and 5-amino-substituted
CC derivatives activated in a cooperative fashion by
CC intracellular H⁺. In quiescent cells upon growth factor
CC stimulation, the apparent affinity for internal H⁺ is increased,
CC resulting in a persistent rise in cytoplasmic pH.
CC CC -1- SIMILARITY: Belongs to the Na⁺/H⁺ exchanger family.
CC CC -1- CAUTION: The number, localization and denomination of hydrophobic
CC domains in the Na⁺/H⁺ exchangers vary among authors.

 CC -!- FUNCTION: Core protein packages viral RNA to form a viral
 CC nucleocapsid, and promotes virion budding. Modulates viral
 CC translation initiation by interacting with HCV IRES and 40S
 CC ribosomal subunit. Also regulates many host cellular functions
 CC such as signaling pathways and apoptosis. Prevents the
 CC establishment of cellular antiviral state by blocking the
 CC interferon-alpha/beta (IFN-alpha/beta) and IFN-gamma signaling
 CC pathways and by inducing human STAT1 degradation. Plays an
 CC important role in virus-mediated cell transformation leading to
 CC hepatocellular carcinomas. Interacts with, and activates STAT3
 CC leading to cellular transformation. May repress the promoter of
 CC p53, and sequester CREB3 and SP10 isoform 3/Sp10b in the
 CC cytoplasm. Also represses cell cycle negative regulating factor
 CC CKN1A, thereby interrupting an important check point of normal
 CC cell cycle regulation. Targets transcription factors involved in
 CC the regulation of inflammatory responses and in the immune
 CC response: suppresses NK-kappaB activation, and activates AP-1.
 CC Mediates apoptotic pathways through association with TNF-type
 CC receptors TNFRSF1A and TNFR, although its effect on death
 CC receptors-induced apoptosis remains controversial. Enhances TRAIL
 CC mediated apoptosis, suggesting that it might play a role in
 CC immune-mediated liver cell injury. Secreted core protein is able
 CC to bind C1QRI at the T-cell surface, resulting in down-regulation
 CC of T-lymphocytes proliferation. May transactivate human MYC. Rous
 CC sarcoma virus LTR, and SV40 promoters. May suppress the human FOS
 CC and HIV-1 LTR activity. May alter lipid metabolism by interacting
 CC with hepatocellular proteins involved in lipid accumulation and
 CC storage (By similarity).
 CC -!- FUNCTION: Envelope glycoproteins E1 and E2 are involved in virus
 CC attachment to the host cell as well as in virus endocytosis and
 CC fusion with host membrane. E2 inhibits human PKR activation,
 CC preventing the establishment of an antiviral state (By
 CC similarity).
 CC -!- FUNCTION: p7 seems to be a hexameric ion channel protein
 CC (viroporin) and is inhibited by the antiviral drug amantadine.
 CC Also inhibited by long-alkyl-chain iminosugar derivatives.
 CC Essential for infectivity (By similarity).
 CC -!- FUNCTION: Protease NS2-3, which is a putative cysteine protease,
 CC is responsible for the autocatalytic cleavage of NS2-NS3. Seems to
 CC undergo self-inactivation following maturation (By similarity).
 CC -!- FUNCTION: NS3 displays three distinct enzymatic activities: serine
 CC protease, NTPase and RNA helicase. NS3 serine protease, in
 CC association with NS4A, is responsible for the cleavages of NS3-
 CC NS4A, NS4A-NS4B, NS4B-NS5A and NS5A-NS5B. NS3 RNA helicase binds
 CC to RNA and unwinds dsRNA in the 3' to 5' direction (By
 CC similarity). NS3/NS4A complex also prevents phosphorylation of
 CC human IRF3, thus preventing the establishment of dsRNA induced
 CC antiviral state.
 CC -!- FUNCTION: NS4B may induce a specific membrane alteration that
 CC serves as a scaffold for the virus replication complex. This
 CC membrane alteration gives rise to the so called ER-derived
 CC membranous web that contains the replication complex (By
 CC similarity).
 CC -!- FUNCTION: NS5A is a component of the replication complex.
 CC Downregulates viral IRES translation initiation. Mediates
 CC interferon resistance, presumably by interacting with and
 CC inhibiting human PKR/p38. The hyperphosphorylated form of NS5A is
 CC an inhibitor of viral replication (By similarity).
 CC -!- FUNCTION: NS5B is a RNA-dependent RNA polymerase that plays an
 CC essential role in the virus replication (By similarity).
 CC -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
 CC precursor polyprotein, commonly with Asp or Glu in the P6
 CC position, Cys or Thr in P1 and Ser or Ala in P1'.

-1- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + [RNA] (N).
-1- COFACTOR: Binds 1 zinc ion per NS3 protease domain. Binds 1 zinc ion per NS5A N-terminal domain (By similarity).
-1- ENZYME REGULATION: Activity of protease NS2-3 is dependent on zinc ions and completely inhibited by EDTA. Serine protease NS3 is also activated by zinc ions (By similarity).
-1- SUBUNIT: Core protein is a homodimer that binds the C-terminal part of E1. Interacts with numerous cellular proteins. Interacts with human STAT1, inducing its degradation and human STAT3, constitutively activating it. Associates with human LTR and TNFRSF1A receptors and possibly induces apoptosis. Binds to human SP110 isoform 3/Sp110b, HNRPK, CLOR1, YWAEF, DDX3X, APOA2 and RXRA proteins. Interacts with human CREB3 nuclear transcription protein, triggering cell transformation. May interact with human p53. Also binds human cytochromes KRT8, KRT18, KRT19 and VIM (vimentin). E1 and E2 glycoproteins form a heterodimer that binds to human LDLR, CD81 and SCARB1 receptors, but this binding is not sufficient for infection, some additional liver specific cofactors may be needed. E2 binds and inhibits human PRKR. p7 forms a homohexamer. NS2 forms a homodimer and interacts with all other nonstructural (NS) proteins. NS4A interacts with NS3 serine protease and stabilizes it. NS3-NS4A complex is essential for the activation of the latter and allows membrane anchorage of NS3. NS4B forms a homodimer and interacts with all other NS proteins. NS5A forms a homodimer and interacts with all other nonstructural (NS) proteins. NS5A also interacts with human PRKR, GRB3, PIK3R1 and with most Src-family kinases. NS5B is a homooligomer (By similarity).
-1- SUBCELLULAR LOCATION: The virion assembly and budding occurs from the ER membrane. The N-terminal transmembrane domains of the glycoprotein probably possess an endoplasmic reticulum (ER) signal sequence function in their C-termini, leading the nascent polypeptide to the ER membrane. After cleavage by host signal peptidase, these ER signal peptides retain at the C-terminus of the concerned proteins (core, E1, E2 and p7), serving as ER membrane anchors. Core protein is cytoplasmic. It is also located on mitochondrial and endoplasmic reticulum membranes and at the surface of lipid droplets. A minor proportion is present in the nucleus. An unknown proportion is secreted. E1, E2, NS2 and NS4B are integral ER membrane proteins. The C-terminal transmembrane domains of envelope glycoproteins E1 and E2 form a hairpin structure before cleavage by host signal peptidase. A reorientation of the second hydrophobic stretch occurs after cleavage producing a single reoriented transmembrane domain. These events explain the final topology of these proteins. ER retention of E1 and E2 is leaky and, in overexpression conditions, a small fraction of both proteins reaches the plasma membrane. NS3 is associated to the ER membrane through its binding to NS4A. Membrane insertion of the membrane-anchored proteins NS4A, NS5A and NS5B occurs after processing by the NS3 protease. NS5A is perinuclear. A fraction of p7 localizes to the plasma membrane (By similarity).
-1- DOMAIN: The transmembrane regions of envelope E1 and E2 glycoproteins are involved in heterodimer formation, ER localization, and assembly of these proteins. Envelope E2 glycoprotein contain two highly variable regions called hypervariable region 1 and 2 (HVR1 and HVR2) and two CD81-binding sites. HVR1 is implicated in the SCARB1-mediated cell entry. HVR2 and CD81-binding sites may be involved in sensitivity and/or resistance to IFN-alpha therapy (By similarity).
-1- DOMAIN: The N-terminal one-third of serine protease NS3 contains the protease activity. This region contains a zinc atom that does not belong to the active site, but may play a structural rather than a catalytic role. This region is essential for the activity of protease NS2-3, maybe by contributing to the folding of the latter. The helicase activity is located in the C-terminus (By similarity).
-1- PTM: Specific enzymatic cleavages in vivo yield mature proteins. The structural proteins, core, E1, E2 and p7 are produced by proteolytic processing by host signal peptidases. The core protein is synthesized as a 21 kDa precursor which is retained in the ER membrane through a hydrophobic propeptide, which is cleaved to

release the 19 kDa mature core protein. The other proteins are cleaved by the viral proteases (By similarity).
-1- PTM: Envelope E1 and E2 glycoproteins are highly N-glycosylated (By similarity).
-1- PTM: Core protein is phosphorylated by host PKC and PKA (By similarity).
-1- PTM: NS5A is phosphorylated in a basal form termed p56. p58 is an hyperphosphorylated form of p56. p56 and p58 coexist in the cell in roughly equivalent amounts. Hyperphosphorylation is dependent on the presence of NS4A in cis. Human AKT1, RPS6KB1/p70S6K, MAP2K1/MEK1 and MAP2K6/MKK6 kinases may be responsible for NS5A phosphorylation (By similarity).
-1- MISCELLANEOUS: Cell culture adaptation of the virus leads to mutations in NS5A, reducing its inhibitory effect on replication (By similarity).
-1- MISCELLANEOUS: The virion is a nucleocapsid covered by a lipoprotein envelope. The nucleocapsid is composed of the core protein forming an internal icosahedral coat that encapsidates the genomic RNA. The envelope contains two proteins: the envelope glycoproteins E1 and E2.
-1- MISCELLANEOUS: Core protein exerts viral interference on hepatitis B virus when HCV and HBV coinfect the same cell, by suppressing HBV gene expression, RNA encapsidation and budding (By similarity).
-1- SIMILARITY: Contains 1 peptidase C18 domain.
-1- SIMILARITY: Contains 1 peptidase S29 domain.
-1- CAUTION: There is a doubt concerning the orientation of the N-terminus of NS4B, which could be luminal with a 5th transmembrane segment. The C-terminus of NS2 may be luminal with a fourth transmembrane segment.

CC -!- FUNCTION: This hormone, released from cells in the corpora cardiaca after the beginning of flight, causes release of diglycerides from the fat body and then stimulates the flight muscles to use these diglycerides as an energy source.
CC -!- SUBUNIT: Adipokinetic hormone precursor-related peptide (APRP) can form three type of disulfide-bond dimers: p1 (alpha-alpha), p2 (alpha-beta), and p3 (beta-beta).
CC -!- SUBCELLULAR LOCATION: Secreted.
CC -!- SIMILARITY: Belongs to the AKH/HRTH/RPCH family.
CC
CC This Swiss-Prot entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation - the European Bioinformatics Institute.
